

The role of lending in the rise of e-agriculture

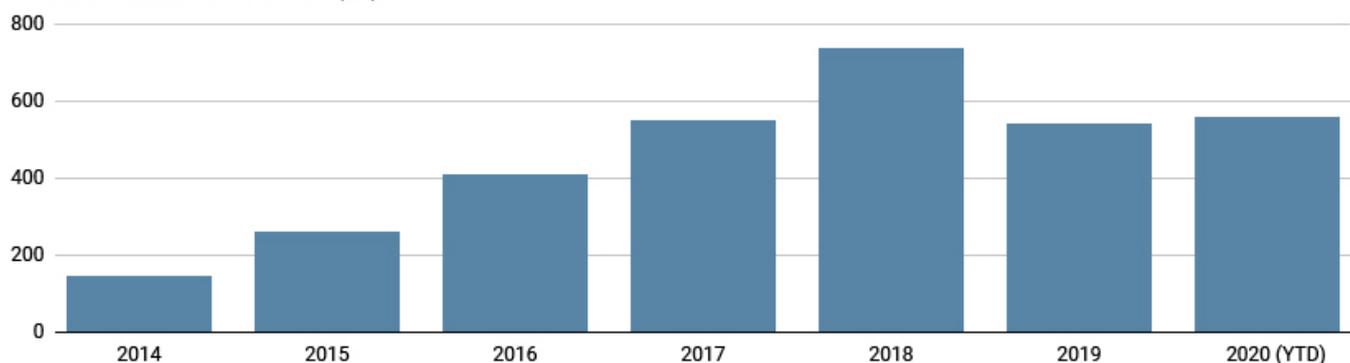

Trishan Ravihansa

With the world moving towards increased [digitalisation](#), the need for e-agriculture is felt more than ever. E-agriculture enriches farmers with data, increases yield and efficiency and improves food distribution with the help of new technologies. Access to real-time statistics of their farms, market conditions and weather forecasts enables farmers to manage their harvests in a sustainable and profitable manner. As consumers show increased interest in healthy foods, farmers can make available data relating to chemical use in food production.

Modern farming technology is used from checking soil moisture levels in the field to forecasting weather through tools such as sensors, cameras, GPS, microphones, accelerometers, gyroscopes, drones and unmanned aerial vehicles. Process-automating technology, such as harvesting robots and automated irrigation systems, is also available. Investment in automation and agricultural robots has increased (see Chart 1) due to concerns over labour shortages amid the coronavirus [pandemic](#).

Use of the internet of things (IoT) and artificial intelligence (AI) in agriculture to optimise output

Modern farms are now able to ensure crops and soil receive exactly what is required, through the use of remote sensors located in the fields (that monitor light, humidity, temperature, soil moisture and crop health), automated irrigation systems, unmanned aerial vehicles, drones and satellites. Site-specific application enable farmers to maintain their farms at optimum levels. The collated data is then used to feed into [AI](#) systems to build algorithms such as image-recognition algorithms to classify plants and detect pests and diseases, and for predictive analysis in terms of yield and

weather conditions. Agricultural robots driven by AI are also deployed at various stages of production. The most advanced AI-enabled farms are able to produce over 20 times more food per acre, using c.90% less water, than traditional fields.

Technological development has also made precision livestock farming possible, optimising animal production by, for example, recognising sick animals and separating them from other animals, and feeding them properly.

How agri-tech companies are financed, and the unique risks inherent in their business

Long-term financial support is necessary for agri-tech companies to carry on their research and development (R&D). Most of these companies are start-ups and are, therefore, mostly funded by angel investors, [private equity firms](#) and venture capital funds. They also benefit from government grants and credit. According to online equity investment platform AgFunder, global investment in agricultural and food technology has increased rapidly recently, but dipped by c.5% to USD19.8bn in 2019, primarily due to a decline in investment in food delivery services (see Chart 2)

Chart 2: Investments in Food and agri-tech

Bank [lending](#) is not that common for agri-tech companies, due to the lack of historical performance records and the inability of these companies to provide collateral. The nature of these companies require patient capital to fund their R&D and other operations. However, the positive impact of agri-tech companies on mitigating [climate change](#) has increased the importance of investing in them globally, as shown in the following world map. Therefore, the creditworthiness of these companies

About Acuity Knowledge Partners

Acuity Knowledge Partners is a leading provider of high-value research, analytics and business intelligence to the financial services sector. The company supports over 350+ financial institutions and consulting companies through a team of over 3,000+ subject matter experts who work as an extension of the clients' teams based out of various global delivery centres.

We empower our clients to drive revenues higher. We innovate using our proprietary technology and automation solutions. We enable our clients to transform their operating model and cost base.
